About The WETIT Wand™

The **WETIT Wand™** is a flexible spray arm that automatically extends into the platform and under the udder of the cow. The wand detects when to spray the udder using the **TSM** (Teat Spray Manager) which calculates the position of the cow in the stall. The WETIT "Cups on Detection" system is built into the TSM to ensure that cows still milking are not sprayed.

WETIT Wand™

Benefits

- Automated teat spraying proven to reduce mastitis and improve teat condition.
- Significantly reduces time and labour.
- Consistent and accurate spraying, enabling teat spray use to be optimised.
- Affordable and low maintenance.
- WETIT's direct and dealer network support for more than 25 years.

Features

- Flexible spray arm that automatically extends under the udder.
- Uses electronic sensors to detect the bale position and cow.
- Identifies the exact moment to spray the teats after the cups are removed.

WETIT Teat Spray Manager (TSM) includes:

- Cow Counter
- Herd Split alarm (optional alarm)
- Cups on/off detection
- 5 different spray settings
- Sensor monitoring for trouble shooting
- Sensor lockout to bypass faulty sensors and continue spraying
